In Part One, the author explores the U.S. health care system from the multiple perspectives of payers, providers, and patients. She address the evolution and role of government in health care, third-party payers, the inability of consumers to receive the best health care at the best price, the problematic relationship between health care and employment (is there a better way other than employer-sponsored health care?), the proper roles of physicians and insurance companies, and solutions for the elderly. Ms. Pipes also asks a pertinent question: why not crack down on pharmaceutical companies and just import cheap drugs? Finally, she addresses the future by tackling lawsuits, the role of quality, and consumer-driven health care in the U.S. Throughout the book, she presents the key themes of expanding consumer choice as a vehicle for change and reforming the U.S. tax code in order to realign incentives to ensure more logical decisions and choices in health care programs. In Part Two, Ms. Pipes reviews the Canadian health care system from multiple perspectives and from the viewpoint of mainstream readers. She explains the single-payer system, the origins of the Canadian care system from multiple perspectives and from the viewpoint of mainstream readers. She explains the single-payer system, the origins of the Canadian health care system and its reliance on employer-provided medical care. Although this book was published in 2004, the year of a U.S. Presidential election, the author does not specifically refer to party candidates or political party platforms. Instead, she presents an “arm’s length” commentary of the U.S. and Canadian systems and supports her statements with factual data as well as references, thus inviting further inquiry on solving the problems of health care objectively.

Unlike the format of many other books, the introductory section in Miracle Cure is rich with information, setting the tone about the key reforms needed to solve the health care crisis. In Part One, the author explores the U.S. health care system from the multiple perspectives of payers, providers, and patients.
